Properly document PHP code

Published Aug 18 2014

Warning: this post is old and might not reflect the current state of the art

Documentation is key to any successful project. Here's a quick introduction to what you should document, and how.

Classes

Start every class with

```
/**
 * Class description
 *
 * @author Your organization or personal name
 * @license MIT (or other licence)
 */
```

(<https://srv.carbonads.net/segment=placement:flaviocopes.com>)

Reduce your bug escape rate with Testim's AI-powered test automation platform. Try it for free.

(<https://srv.carbonads.net/segment=placement:flaviocopes.com>)

Properties

Document every property with

```
/**
 * Property brief description
 *
 * @var type
 */
```

Methods

Document every method with

```
/**
 * Method brief description
 *
 * Method longer description and help
 */
```

If you method accepts parameters, add them

```
* @param type $param1 The param1 description
* @param type $param2 The param2 description
```

If your method returns something, describe the return value

```
* @return $this
```

If your method throws an exception, describe the exception

```
* @throws \Exception
```

Code

Code inside methods needs to be documented if needed.

Do not document what the code is doing, document what the code should do.
